C++ Voting Model Implementation

Alexander Holiday

06/06/2013

Abstract

The voting model detailed in [**?**] is implemented in C++ in both rewiring regimes. The behavior of our implementation differs from that presented in [**?**] for unknown reasons. In particular, while we observe the random walk behavior for certain values of alpha, the arc has support on (0,1) regardless of the alpha under investigation.

1 Introduction
